
Doubtless the plant occurs elsewhere in the United States, but has been mistaken for B. nigra because of its appressed pods. The above transfer is made with some hesitation, following the lead of Wheeler. Dr. Wheeler admits that his adoption of the name Erassica kaber in place of B. arvensis (L.) Rabenhorst (not B. arvensis L.) is not the result of taxonomic study, but merely of examination of the synonymy given by Schulz in Das Pflanzenreich—not necessarily an unimpeachably complete account of all possibly pertinent nomenclatorial data.—Lloyd H. Shinners, Southern Methodist University, Dallas, Texas.

Potamogeton oblongus, not P. polygonifolius.—

Mansfeld in Fedde, Repert. xlv. 209 (1938), summarizing the situation, concludes that Potamogeton polygonifolius belongs to P. alpinus Balbis (1804) and that the name P. oblongus must be used for the plant which has erroneously passed as P. polygonifolius.—M. L. Fernald.

Vol. 52, no. 616, including pages 61-76 and plates 1157-1160, was issued 12 April, 1950.
